INDIVIDUAL EXTENSION / UW IS 445

Gen Z spending: profiles to test

Independent extension of a UW IS 445 course group project

1,700
financial records | ages 18-27

0.0301
Pearson r: income vs consumption

50.59%
consumption > income

Consumption sums ten categories and excludes savings/investments. Mean individual consumption shares: education + fitness 23.81%; travel + entertainment 25.21%. These are analyst-defined groupings.

Four designed financial groups | one marketing test each

Lower income < sample median $4,743; higher income >= median. Crossed with consumption > income versus <= income. No natural clusters are claimed.

A **Lower income; consumption > income | n=745 (43.82%)**
Mean income $2,995; consumption $4,949 (USD; period unknown).
Test a small, one-time starter bundle with its full price visible before checkout.

B **Lower income; consumption <= income | n=104 (6.12%)**
Mean income $4,115; consumption $3,480 (USD; period unknown).
Test an optional low-entry education or fitness trial without automatic renewal.

C **Higher income; consumption > income | n=115 (6.76%)**
Mean income $5,387; consumption $5,997 (USD; period unknown).
Test a fixed-total-price education and fitness bundle, without installment or credit messaging.

D **Higher income; consumption <= income | n=736 (43.29%)**
Mean income $6,550; consumption $4,664 (USD; period unknown).
Test an optional experience upgrade alongside a clearly priced standard offer.

Separate shopping check | synthetic learning data

Age 18-27: n=723; age 28-70: n=3,177. Payment, shipping, frequency and category: 0/4 comparisons have Holm-adjusted $p < 0.05$ (adjusted p 0.768-1.000; Cramer's V 0.022-0.044). This is a method demonstration, not evidence for real-customer targeting.

Interpretation limits

Financial sampling, collection period and real-versus-synthetic origin are unknown. USD amounts have no documented time unit. Shopping data are synthetic; the two samples are not joined. Correlation is not causation. Test suggestions are hypotheses, with no measured effectiveness or established preference differences.
